CARRE is a Specific Targeted Research Project partially funded by the European Union, under FP7-ICT-2013-10, Theme 5.1: "Personalized health, active ageing & independent living".

CARRE factsheet

Project identifier	FP7-ICT-2013-611140
Project acronym:	CARRE
Project title:	Personalized patient empowerment and shared decision support for cardiorenal disease and comorbidities
Work programme topic:	ICT-WP-2013.5.1 Personalized health, active ageing, and independent living Target outcome b) Personalised Guidance Services for management of co-morbidities and integrated care
Funding scheme:	Small or medium-scale focused research project (STREP)
Project budget:	3,210,470€
EC funding:	2,573,755€
Duration:	36 months
Start date:	1 November 2013
End date:	31 October 2016
Consortium partners:	<ol style="list-style-type: none"> 1. Democritus University of Thrace (DUTH) – Greece 2. The Open University (OU) – United Kingdom 3. University of Bedfordshire (BED) – United Kingdom 4. Vilnius University Hospital Santariškių Klinikos (VULSK) – Lithuania 5. Kaunas University of Technology (KTU) – Lithuania 6. CARRE in a Nutshell

CARRE is an EU FP7-ICT funded project with the goal to provide innovative means for the management of comorbidities (multiple co-occurring medical conditions), especially in the case of chronic cardiac and renal disease patients or persons with increased risk of such conditions.

Sources of medical and other knowledge will be semantically linked with sensor outputs to provide clinical information personalised to the individual patient, so as to be able to track the progression and interactions of comorbid conditions. Visual analytics will be employed so that patients and clinicians will be able to visualise, understand and interact with this linked knowledge and also take advantage of personalised empowerment services supported by a dedicated decision support system.

The ultimate goal is to provide the means for patients with comorbidities to take an active role in care processes, including self-care and shared decision-making, and also to support medical professionals in understanding and treating comorbidities via an integrative approach (Figure 1).

Figure 1. CARRE puts patient at the center.

Motivation

Comorbidity refers to the presence of one or more disorders in addition to a primary disease or disorder (either independently, or as a consequence of the primary condition or otherwise related). As approximately half of all patients with chronic conditions, even in a nonelderly population, have comorbidities, comorbidity management is a hot topic in current medical literature. When addressing disease in the presence of comorbidities, each different medical condition the patient presents should not be viewed independently, but a “patient as a whole” view approach should be followed. This places an emphasis on an extra burden of dealing successfully with all associations, interactions, co-dependencies, implications, adverse events, etc. that occur between different conditions co-presenting at the same patient at the same time, as well as between the different treatment regimens these conditions involve.

One common case of comorbidities is the chronic cardiorenal disease, which is the condition characterized by simultaneous kidney and heart disease while the primarily failing organ may be either the heart or the kidney. Very often the dysfunction occurs when the failing organ precipitates the failure of the other. The cardiorenal patient (or the person at risk of this condition) presents an interesting case example for addressing and demonstrating novel patient empowerment services for personalized disease & comorbidities management and prevention for a number of reasons as chronic cardiorenal disease has an increasing incidence and a number of serious (and of increasing incidence) comorbidities.

One of the most important aspects of cardiorenal disease and comorbidities diagnosis and treatment is early detection and aggressive management of underlying causes. Preventing progression to end stage renal and cardiac deficiency may improve quality of life and help save health care costs. Prevention of the disease includes: lifestyle modification (controlling obesity, diabetes and hypertension), public-health education for reduction of excessive bodyweight, regular exercise, and dietary approaches, control of hypertension, dietary protein restriction and blood-pressure control, proteinuria management, dyslipidaemia management and smoking cessation. Delaying disease progression is crucial and must include patient education and aggressive treatment and management of chronic cardiorenal disease and its comorbidities. However, effective implementation of such strategies will only come when both the general public and the health care professionals community work together towards public awareness and lifestyle management on a personal basis and following an integrated care approach.

Objectives

CARRE aims to innovate towards a service environment for providing personalized empowerment and shared decision support services for cardiorenal disease comorbidities.

The core of CARRE effort lies in semantic interlinking of three types of data (a) medical ground knowledge (b) up-to-date medical evidence and (c) personal patient data in order to create a personalized model of the disease and comorbidities progression pathways and trajectories (Figure 2). Visual presentations of this personalized model (against ground knowledge and against statistical views of ‘similar’ patient groups) will form the basis for patient empowerment services that will target understanding of comorbidities in the personal setting. Finally, the personalized model of comorbidities will be used for shared decision support services targeting personalized education, complex risk calculation for disease progression and comorbidity trajectories, alerts for adverse events of multiple co-existing treatments and personalized planning for monitoring.

CARRE aims at creating a dynamic cross referencing of semantically related personalized and evidence based related data.

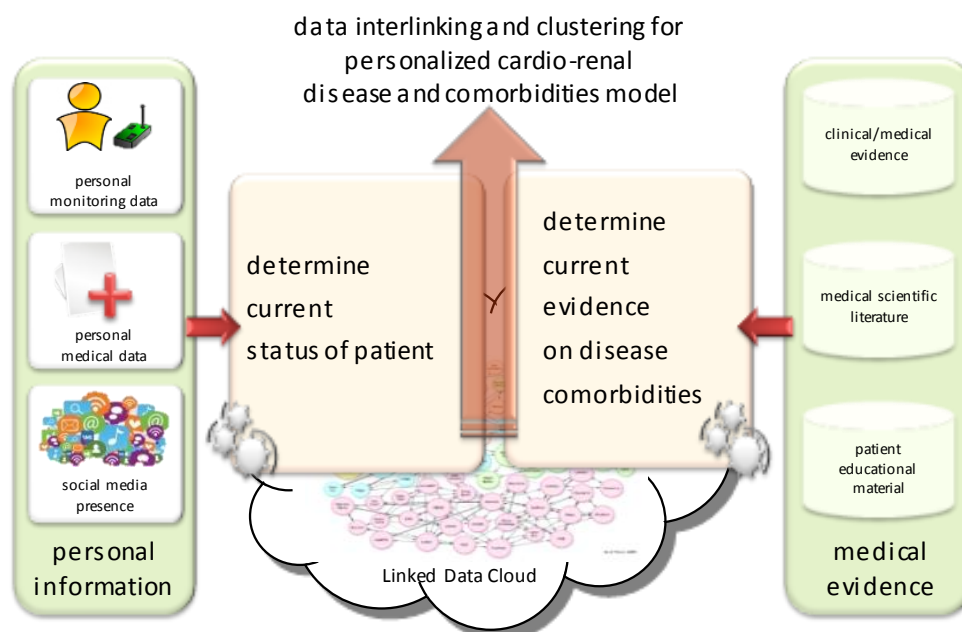

Figure 2. Shifting the focus towards personalized comorbidity management in CARRE.

The overall technological goal of CARRE project is to show the potential of semantic interlinking of heterogeneous data to construct dynamic personalized models of complex comorbid medical conditions with disease progression pathways and comorbidity trajectories. Also, to show that visual analytics based on such models can support patient understanding of personal complex conditions (projected against ground knowledge and statistical views of similar patient population) and be the basis for shared decision support services for the management of comorbidities. In specific the project aims to:

- provide visual and quantitative understanding of disease progression pathways and comorbidities trajectories, as enriched with up-to-date medical evidence and personalized for the individual patient;
- provide personalized risk calculations and analytics for comparison of personal state with the current medical evidence and the overall statistical views of ‘similar’ patients;
- use the personalized model of comorbidities for building shared decision support services targeting personalized education, complex risk calculation for disease progression and comorbidity trajectories, alerts for adverse events of multiple co-existing treatments and personalized planning for comorbidity monitoring and treatment.

Consortium

In order to achieve the above objectives, CARRE consortium is driven by two partners from the medical domain (University Hospitals), namely **DUTH** and **VULSK** with a clear long experience in medical research in cardiorenal disease and comorbidities as well as with a long record of developing and deploying successful informatics interventions in the real healthcare setting. The core semantic model and interlinking is performed by **OU** a leading expert in semantic technologies, while **BED** undertakes the work on visual analytics and cloud computing – both partners also contribute their long experience in semantic information extraction from unstructured data sources and web service oriented architectures. **KTU**, with a long proven innovation experience in personal sensors and sensor networks for cardiorenal disease tackles the integration of personalized sensor data. Finally, **PIAP** an established partner in security and automation systems brings in the required expertise on decision support systems and on systems security and data privacy.

CARRE consortium partners concise presentation:

No	Acronym	Full Name	Country	Team Leader
1	DUTH	Democritus University of Thrace	Greece	Prof. Eleni Kaldoudi
2	OU	The Open University	United Kingdom	Prof. John Domingue
3	BED	University of Bedfordshire	United Kingdom	Dr. Enjie Liu
4	VULSK	Vilnius University Hospital Santariškių Klinikos	Lithuania	Dr. Domantas Stundys
5	KTU	Kaunas University of Technology	Lithuania	Prof. Arunas Lukosevicius
6	PIAP	Industrial Research Institute for Automation and Measurements	Poland	Prof. Roman Szewczyk

Expected outcomes

The outcomes of the project will be a set of personalised empowerment and shared decision support services as well as respective tools and technologies (Figure 3).

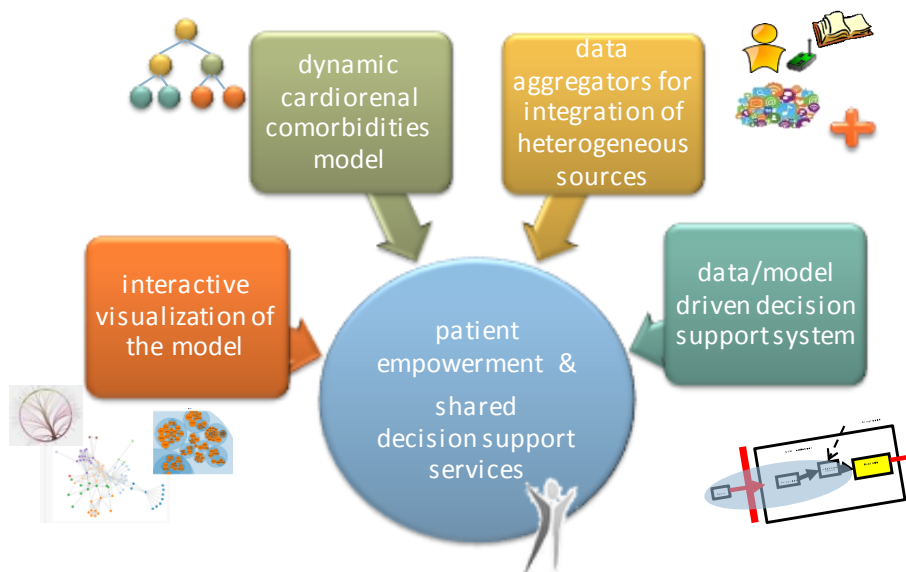

Figure 3. CARRE expected interim and final outcomes.

Major expected technological breakthroughs include:

- an ontology and schema for the description of comorbidities management (in the case of cardiorenal disease and comorbidities);
- data aggregators for integration of heterogeneous sources of information, such as medical evidence, personal data (including dynamic sensor data), medical information and personal disposition & lifestyle;
- text analysis tools to semantically annotate and extract relevant metadata from unstructured sources (medical evidence, social media);
- generic aggregator technology to harvest semantic information from structured data sources as listed above (e.g. personal sensors, educational content items);
- linked data technologies for semantic data interlinking, and enrichment;
- tools and infrastructure for large scale processing of aggregated data for visual analytics mentioned above;
- data/model driven decision support systems to build shared decision support services for the patient and the medical professional based on the personalized comorbidities model of the patient.

Methodology and work plan

The work of CARRE project is organized in 6 technical work packages, complemented by one work package dedicated to project management and one reserved for dissemination and exploitation activities, for a total duration of three years.

Work in each technical work package is led by one consortium partner who commits the main effort based on their expertise, in collaboration with all other partners with complementary expertise required for the various tasks and the smooth integration and cross-fertilization across tasks and WPs.

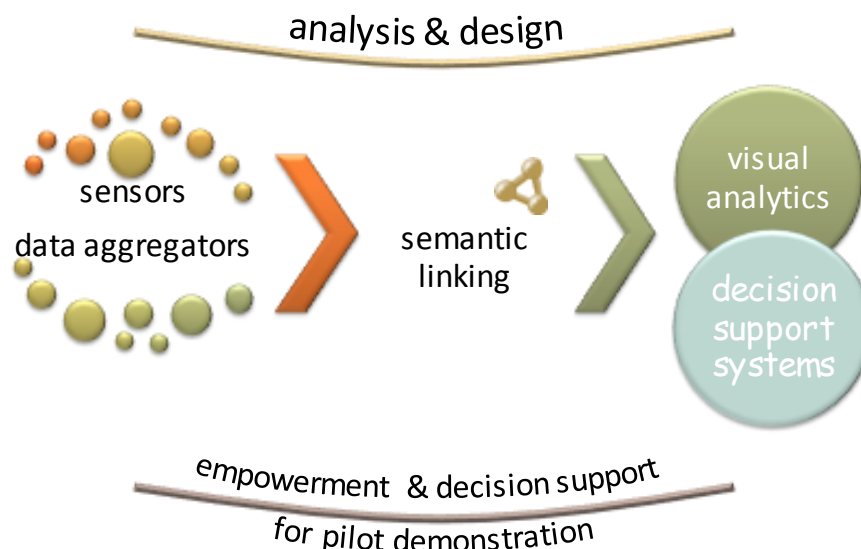

Figure 4. Overview of CARRE technical work plan.

The technical work packages include (Figure 4):

- **Domain analysis, requirements and design**, with activities pertaining to domain analysis, use case definition and design, including the CARRE information model, metadata scheme and ontology, as well as the overall design of the environment;

- **Data and metadata harvesting**, with activities related to harvesting of all heterogeneous data sources related to CARRE – initial task in this WP includes a generic design of the data aggregator for all data sources.
- **Data enrichment, correlation and interlinking**, for the integration, schema mapping and interlinking of the (meta)data provided by the previous work package into a semantic repository;
- **Data management and visual analytics**, with activities pertaining to large-scale graph data management and visualization of the semantic repository and in specific of the personalized comorbidities model for patient empowerment.
- **Empowerment & decision support services**, for the development of personalized shared decision support services; and
- **System integration and evaluation**, for system and service testing and integration, use case deployment and evaluation.

Impact

CARRE project aims to develop an integrated service environment for personalized patient empowerment and shared decision support services for cardiorenal disease and comorbidities. In specific, it aims to:

- (a) provide visual and quantitative understanding of disease progression pathways and comorbidities trajectories, as enriched with up-to-date medical evidence and personalized for the individual patient;
- (b) provide personalized risk calculations and analytics for comparison of personal state with the current medical evidence and the overall statistical views of 'similar' patients;
- (c) use the personalized model of comorbidities for building shared decision support services targeting personalized education, complex risk calculation for disease progression and comorbidity trajectories, alerts for adverse events of multiple co-existing treatments and personalized planning for comorbidity monitoring and treatment.

Specific expected impacts of the project include:

Strengthened quality of life: CARRE aims at strengthening the cardiorenal patient, mainly by reinforcing the patient understanding of the disease and its comorbidities complex interdependencies as they are personalized to the specific patient. Based on this understanding, the project aims to deliver personalized treatment stratification, monitoring alerts and education. CARRE thus implements the “*patients getting up off their knees*” mandate of current patient empowerment initiatives

Reinforced medical knowledge: A recent thorough treatment of comorbidity management suggests that one way to improve care in such cases is to cross reference evidence, knowledge and guidelines for each condition. Simple cross referencing of existing medical evidence and guidelines for all possible combinations of conditions would quickly make it unreadable and thus inefficient. Thus, CARRE follows a personalized and semantically enriched approach to create dynamic cross referencing of related evidence data and medical knowledge with respect to efficient management of cardiorenal comorbidities

Involvement of care authorities in development of personalised care solutions: In contemporary healthcare systems people are usually defined in terms of economic and professional frameworks and are reduced to being mere consumers in need of satisfying, or passive patients in need of treatment or education. In any case, they are not seen as active participants in their own right. CARRE follows an approach of “*first understand, then conquer, then decide*” which targets both the patient and the medical professional. As such it is designed to steer the active involvement of patients and health authorities in the management of comorbidities.

Education for patients and care givers: In order to engage effectively the public (including patients and care givers) ICT technology providers have to somehow address the intellectual gap that usually exists when interventions unavoidably designed and developed by technocrats are offered to be used by the layman. CARRE addresses effectively at least one aspect of this gap, which relates to the often long distance between medical and layman terms involved in the description of disease and treatment plans via semantic coupling either via Linked Data Cloud or dedicated semantic tools.

Improved interaction for patients: Enhancing the patients' and care givers' understanding of the complex interrelations of treatments, adverse events, lifestyle management and disease projections in the case of cardiorenal comorbidities is the basic common ground for understanding each other, and clarifying roles and dispositions, thus enhancing eventually collaboration and participation in the care process.

Improved cooperation between the providers of health: CARRE will provide medical professionals with an overall personalized to the patient visualization of cardiorenal disease and comorbidity projections, as well as with a set of decision support services including comorbidity monitoring planning, alerts for changing plans and alerts of changed risk factor calculation. All these will drive a better and timely communication of the healthcare providers with their peers and the patient caregivers, thus enhancing their collaboration.
